

The Crestline System Check™

If you're like most businesses today, your business isn't about computers yet it relies heavily on the performance, reliability, and security of your computers.

Every time your computers crash, grind to a halt, your e-mail goes down, or you lose an important file, employee productivity and business profitability is reduced. If your entire network goes down, or worse yet, suffers irrecoverable data loss, the impact on your business could be disastrous. According to research firm DTI, 70 percent of businesses who suffer major data loss go out of business within 90 days.

Crestline Computer Solutions understands how critical your computer system is to the survival and profitability of your business. That's why we've developed the Crestline System Check to help you determine the health of your computer systems and identify how you can make them safer and more efficient.

A Snap Shot of Your Computer Network

The Crestline System Check is a no-obligation service that provides you with a detailed review and analysis of your computers and network, so you can make intelligent choices about maintaining, improving and securing your computer systems. Based on your current needs and future plans, Crestline will analyse your computer hardware and network infrastructure to determine how best to maximise the performance, reliability and security of your technology investment.

After completing the Crestline System Check, you will receive an inventory of your current hardware and software, as well as a written report that includes recommendations on how to enhance the performance, reliability and safety of your systems. With this information, you will also be able to make an informed business decision to ensure that your technology strategy is in line with your business strategy.

System Check Components

End User Assessment

- Determine business requirements
- Review current computer usage
- Assess performance of user experience
- Interview key decision makers on future growth plans

Performance and Reliability

- Review desktop and server operating systems
- Determine update/service patch status
